Generally speaking, Biosignals refer to signals recorded from

the human body. They can be either electrical (e. g. Electrocardiogram (ECG), Electroencephalogram (EEG), Electromyogram (EMG), etc.) or non-electrical (e. g. breathing, movements, etc.). The acquisition and processing of such signals play an important role in clinical routines. They are

usually considered as major indicators which provide clinicians and physicians with useful information during diagnostic and monitoring processes. In some applications, the purpose is not necessarily medical. It may also be industrial. For instance, a real-time EEG system analysis can be used to control

and analyze the vigilance of a car driver. In this case, the purpose of such a system basically consists of preventing crash risks. Furthermore, in certain other applications, a set of biosignals (e. g. ECG, respiratory signal, EEG, etc.) can be used to control or analyze human emotions. This is the case of the famous

polygraph system, also known as the "lie detector", the efficiency of which remains open to debate! Thus when one is dealing with biosignals, special attention must be given to their acquisition, their analysis and their processing capabilities which constitute the initial stage preceding the clinical diagnosis.
