Bulk Metallic Glass - an overview | ScienceDirect Topics

Bulk metallic glasses (BMGs), which are non-crystalline metallic alloys, can be fabricated with low cooling rates in many alloy systems. So, it is possible to produce BMGs that are several centimeters thick. BMGs exhibit useful engineering properties of high mechanical strength and high corrosion resistance.

Abstract. Bulk metallic glasses (BMGs) can exhibit excellent combinations of strength and fracture toughness that cannot be achieved by traditional metals, making them attractive for load bearing, mechanical engineering applications. Furthermore, recent research on BMGs has shown that many early perceived shortcomings, such as apparent brittleness or poor fatigue resistance, are not as big of a problem as once thought.

Bulk Metallic Glasses as Structural Materials: A Review ...

This introduction presents an overview of the key concepts discussed in the subsequent chapters of this book. The book introduces the basic concepts of metallic glasses and differentiates between crystalline and glassy materials, with special emphasis on the differences between noncrystalline, glassy, and amorphous solids.

Bulk Metallic Glass The structure of metallic glass is very different from that of conventional metals. Rather than arranging themselves into repeating patterns of grains, the atoms of metallic glasses are "frozen" in a random, disordered structure, similar to regular window glass. It even has a smooth surface like glass.

What Is Bulk Metallic Glass? - Streetdirectory.com

An amorphous metal (also known as metallic glass or glassy metal) is a solid metallic material, usually an alloy, with a disordered atomic-scale structure. Most metals are crystalline in their solid state, which means they have a highly ordered arrangement of atoms. Amorphous metals are non-crystalline, and have a glass-like structure.

Metallic glasses or amorphous metals are novel engineering alloys in which the structure is not crystalline (as it is in most metals) but rather is disordered, with the atoms occupying more-or-less random positions in the structure.

Metallic elements having negative enthalpies of mixing tend to form characteristic local atomic clusters. In this review, we use the structural information in the first nearest neighbour shell level, or first-shell atomic cluster, to derive the composition rules of two types of complex alloy phases, quasicrystals and bulk metallic glasses, both being composed of elements with negative ...

Currently, a number of alloys with critical cooling rates low enough to allow formation of amorphous structure in thick layers (over 1 millimeter) have been produced; these are known as bulk metallic glasses (BMG). More recently, batches of amorphous steel with three times the strength of conventional steel alloys have been produced .
