Oral Motor and Pharyngeal-laryngeal Exercises. These exercises are designed to increase the strength and range of motion in your lips, tongue, jaw, and muscles used for swallowing, which will help your speech and/or swallowing function. When completing these exercises, it is important to move the designated area as far as you can in each direction until you feel the muscles stretch.

INTRODUCTION. The movement of food in the oral cavity towards the pharynx differs depending on the type of food (liquid or solid).¹ For children with dysphagia, abnormalities in the pharyngeal phase often accompany oral-motor dysfunction. Reilly et al.² reported that over 90% of children with cerebral palsy have oral-motor dysfunction and 38% of them have swallowing problems.

Treatment for Dysphagia - Information Technology

Motor and sensory innervation of the majority of the pharynx (except nasopharynx) is achieved by the pharyngeal plexus. The pharyngeal plexus, which mainly overlies the middle pharyngeal constrictor, is formed by: Pharyngeal branches from the glossopharyngeal nerve (CN IX). Pharyngeal branch of the vagus nerve (CN X).
