"The third edition of the Handbook of Proteolytic Enzymes is a fully revised and updated major reference work in Elsevier's canon. For the first time the Handbook will be available as an online via Elsevier's ScienceDirect platform as well as a three-volume book. The online version will have the enhanced options including online multimedia, cross-referencing capabilities, integrated online delivery and closer integration with the online MEROPS database of peptidases and their inhibitors. This reference work is intended for university libraries, researchers and students, and will be of great interest to the pharmaceutical and biotechnology companies." --description from Elsevier.com.

Handbook of Proteolytic Enzymes, Second Edition, Volume 1: Aspartic and Metallo Peptidases is a compilation of numerous progressive research studies on proteolytic enzymes. This edition is organized into two main sections encompassing 328 chapters. This handbook is organized around a system for the classification of peptidases, which is a hierarchical one built on the concepts of catalytic type, clan, family and peptidase. The concept of catalytic type of a peptidase depends upon the chemical nature of the groups responsible for catalysis. The recognized catalytic types are aspartic, cysteine, metallo, serine, threonine, and the unclassified enzymes, while clans and families are groups of homologous peptidases. Homology at the level of a family of peptidases is shown by statistically significant relationship in amino acid sequence to a representative member called the type example, or to another member of the family that has already been shown to be related to the type example. Each chapter discusses the history, activity, specificity, structural chemistry, preparation, and biological aspects of the enzyme. This book will prove useful to enzyme chemists and researchers.

The Handbook of Proteolytic Enzymes: Metallopeptidases has stood as most comprehensive work in the field of applied enzymology and biocatalysis since the first edition published in 1998. Extensively revised and updated, the new, fourth edition is an essential reference for biochemists, biotechnologists, and molecular biologists across academia and industry. Edited by world-renowned experts in the field and with five volumes available for individual sale, this work provides detailed information on all known proteolytic enzymes researched to date, with expanded coverage of metallopeptidases, cysteine peptidases, serine and threonine peptidases, aspartic and glutamic peptidases, and inhibitors of proteolytic enzymes. This volume, Metallopeptidases, includes over 300 chapters on known metallopeptidases, including their name, history, activity and specificity, structural chemistry, preparation, biological aspects, and distinguishing features, with 2D and 3D structures of peptidases in color, extensive references, and links to PubMed and MEROPS databases. The only comprehensive book on Metallopeptidases with over 300 peptides included Each chapter written by experts in their field, on proteolytic enzymes from all groups of living organisms and viruses, including those that are currently major targets of pharmaceutical research Fully searchable text, 2D and 3D structures of peptidases in color, and links directly to PubMed and MEROPS databases Details the latest proteolases used in therapeutic research, and discusses recent drug trials
